About this document

Product registration services allow products to register with MVS™ when they are running on a particular system. Other products can then use registration services to determine what products are running on a particular system.

Product registration provides an additional function for optional products, or elements, of z/OS. These optional products, which can be either products, product features, or combinations of product and feature, can use registration services to determine, based on a policy the customer sets, whether they are enabled to run on a particular system.

This book describes how to use registration services.

Who should use this document

This book is for programmers who design and write, in assembler, C, or Java™ programs that use registration services. It requires an understanding of how to work with MVS system interfaces.

How to use this document

This book is one of the set of programming books for MVS. This set describes how to write programs in assembler language or high-level languages, such as C, FORTRAN, and COBOL. For more information about the content of this set of books, see [z/OS Information Roadmap](#).

Note: If you call the services described in this book from assembler language programs, you must use a high-level assembler.

Where to find more information

Where necessary, this book references information in other books, using shortened versions of the book title. For complete titles, and order numbers of the books for all products that are part of z/OS, see [z/OS Information Roadmap](#).

What Java level support is necessary for product registration

The product registration Java support requires that the following Java level or higher be installed:

- IBM® SDK for z/OS Java 2 Technology Edition, Version 1.4 PTF UQ93743, product number 5655-I56.

How to send your comments to IBM

We invite you to submit comments about the z/OS product documentation. Your valuable feedback helps to ensure accurate and high-quality information.

Important: If your comment regards a technical question or problem, see instead [“If you have a technical problem”](#) on page ix.

Submit your feedback by using the appropriate method for your type of comment or question:

Feedback on z/OS function

If your comment or question is about z/OS itself, submit a request through the [IBM RFE Community \(www.ibm.com/developerworks/rfe/\)](#).

Feedback on IBM Documentation function

If your comment or question is about the IBM Documentation functionality, for example search capabilities or how to arrange the browser view, send a detailed email to IBM Documentation Support at ibmdocs@us.ibm.com.

Feedback on the z/OS product documentation and content

If your comment is about the information that is provided in the z/OS product documentation library, send a detailed email to mhvrfs@us.ibm.com. We welcome any feedback that you have, including comments on the clarity, accuracy, or completeness of the information.

To help us better process your submission, include the following information:

- Your name, company/university/institution name, and email address
- The following deliverable title and order number: z/OS MVS Programming: Product Registration, SA38-0698-50
- The section title of the specific information to which your comment relates
- The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive authority to use or distribute the comments in any way appropriate without incurring any obligation to you.

IBM or any other organizations use the personal information that you supply to contact you only about the issues that you submit.

If you have a technical problem

If you have a technical problem or question, do not use the feedback methods that are provided for sending documentation comments. Instead, take one or more of the following actions:

- Go to the [IBM Support Portal \(support.ibm.com\)](#).
- Contact your IBM service representative.
- Call IBM technical support.

Summary of changes

This information includes terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations for the current edition are indicated by a vertical line to the left of the change.

Note: IBM z/OS policy for the integration of service information into the z/OS product documentation library is documented on the z/OS Internet Library under [IBM z/OS Product Documentation Update Policy \(www-01.ibm.com/servers/resourcelink/svc00100.nsf/pages/ibm-zos-doc-update-policy?OpenDocument\)](http://www-01.ibm.com/servers/resourcelink/svc00100.nsf/pages/ibm-zos-doc-update-policy?OpenDocument).

Summary of changes for z/OS MVS Programming: Product Registration for Version 2 Release 5 (V2R5)

This information contains no technical changes for this release.

Summary of changes for z/OS MVS Programming: Product Registration for Version 2 Release 4 (V2R4)

This information contains no technical changes for this release.

Summary of changes for z/OS MVS Programming: Product Registration for Version 2 Release 3 (V2R3) and its updates

This information contains no technical changes for this release.

Chapter 1. Using Registration Services

Product registration provides a common mechanism for products to:

- Register (indicate that they are running) on a particular system
- Determine what products are registered (running) on a particular system

With z/OS, products, such as z/OS features, can use registration services to determine if they are enabled to run on a particular system. *z/OS MVS Product Management* describes product enablement, which requires that the product be defined appropriately in the enablement policy for the system.

The IFAPRDxx parmlib member contains the enablement policy, which the customer defines for a system.

Figure 1 on page 1 shows how the product code, the enablement policy, and MVS registration services fit together to determine whether a product is enabled.

Figure 1. An Overview of Product Enablement

As Figure 1 on page 1 shows, the product code issues the register request to indicate that it is running and check its enablement status. The customer policy in IFAPRDxx defines enablement status for products. When MVS processes the register request, it matches the product name definition in the request with the entries in the enablement policy to determine if the product is enabled on the system, then issues a return code to indicate enablement status. Based on the return code, the product continues to run or ends its processing.

If you are interested in how to enable a product, see:

- *z/OS MVS Product Management* for information about product enablement and reporting on registered products.
- *z/OS MVS Initialization and Tuning Reference* for an explanation of how to update IFAPRDxx.
- *z/OS Planning for Installation* for a description of how to enable z/OS features.

This book, in contrast, describes how to use registration services. It is for the product programmer who needs to know:

- How to use registration services to register a product. See “[Registering a Product](#)” on page 2.
- How to use registration services to check product status — determine if a product is registered or enabled, or both, on a particular system. See “[Checking Product Status](#)” on page 3.

Registration services provide a standard mechanism for determining when a product is running or enabled on a system. Thus, the services are useful for all products with known dependencies on other IBM products or the products of independent software vendors or solution providers.

Examples of using the services appear in [Chapter 3, “Examples,”](#) on page 31.

Registering a Product

To register a product, issue the Register service. See “Using the Register Service ” on page 2. When a product calls the Register service, MVS determines, based on the register request and the enablement policy defined in IFAPRDxx, whether or not the product is enabled to run on the system.

If the Register request type and the policy entry indicate that the product can run on the system, MVS registers the product as one that is running. Other products can then use the Query_Status and List_Status services to check whether your product is running. The system and other products assume that a product that is registered is a product that is running on a particular system.

Thus, it is important that, when your product finishes processing, it issue the Deregister service to tell MVS that it is no longer running. See “Using the Deregister Service ” on page 2.

Using the Register Service

When a product issues the Register service, the system checks the enablement policy in IFAPRDxx. If the check is successful, MVS issues a return code of 0 and adds the product to its list of registered (running) products.

For the check to be successful, you need to select the type of Register request very carefully, depending on what you want to do:

- To register your product without regard to the enablement policy, select **Ifaedreg_Type_Required**. When it processes your request, the system does not check the enablement policy. Use this register request when you are registering only to allow other products:
 - To determine if your product is running.
 - To access information you provide through the **Features** parameter.
- To register your product and consider it enabled even if there is no entry in the policy, select **Ifaedreg_Type_Standard**. This type of request is useful when your product can be enabled without any user change to the policy in IFAPRDxx. With the standard register request, you get return code 4 (indicating that the product is disabled) only when there is a matching statement that explicitly disables the product.
- To register your product and consider it disabled when there is no entry in the policy, select **Ifaedreg_Type_NotFoundDisabled**. For the request to be successful, there must be a matching statement in the policy that explicitly enables the product. You get return code 4 when the product is explicitly disabled or when there is no matching statement.

The product definitions in the enablement policy can contain wildcard characters (? and *), and MVS allows wildcard matching so that a single policy statement can apply to multiple products.

Because of the interaction between the product definition in the register request, the type of register request, and the contents of IFAPRDxx, make sure that your product documentation provides the information users need to update IFAPRDxx, as described in [z/OS MVS Initialization and Tuning Reference](#).

The placement of the Register request in your product code is also important. Most products and separately orderable features would invoke the Register service during initialization. Products or features that have multiple entry points or that allow branch entry must consider registering at each possible point of invocation.

If other products need information about your product, you can use the **Features** parameter to pass the information. Callers of the Query_Status service can obtain this information, but you need to define its contents and format to enable the callers to interpret the information correctly.

See “Register Service (IFAEDREG) ” on page 6 for a complete description of the service, including the various types of register request.

Using the Deregister Service

While the system can automatically deregister a product during task or address space termination, it is a good practice to issue the Deregister service when a registered product completes its processing.

Issuing the Deregister service ensures that any status queries that other products issue return correct results. The system considers a registered product to be a running product. If your product stops running but does not deregister, any query of its status will indicate that it is still running.

See [“Deregister Service \(IFAEDDRG\)”](#) on page 13 for a complete description of the service.

Checking Product Status

There are two services you can use to check product status:

- Query_Status, described in [“Query_Status Service \(IFAEDSTA\)”](#) on page 15
- List_Status, described in [“List_Status Service \(IFAEDLIS\)”](#) on page 19

Which service you need depends on the information your product requires:

- To determine if a specific product is registered and obtain its enablement status (enabled, disabled, or not known), issue the Query_Status service.
- To obtain information about the registration and enablement status of one or more products, issue the List_Status service.
- To determine what entry in the enablement policy the system would use to determine the enablement status of a particular product, issue the List_Status service.

Both services return information in data areas mapped for the assembler language programmer in mapping macro IFAEDIDF and for the C programmer in include file IFAEDC.

Before you issue either service, you need to know how any product you are interested in was defined when it was registered.

If you are using Query_Status to request the status of a specific product, you might need additional documentation from the product. When a product registers, it can provide information for the system to pass to the caller of Query_Status. If you are interested in a product that provides this additional information, you need to understand the content and format of the information you will receive.

Chapter 2. Coding Registration Services

There are four registration services:

- Register service — registers a product or feature with MVS
- Deregister service — deregisters a product, usually done when an element completes processing.
- Query_Status service — checks the status of a specific product
- List_Status service — checks the status of one or more products

These callable services share common invocation characteristics and common processing considerations.

Invoking the Services

The following information describes the environment required, restrictions, register information, performance implications, and abend codes for the registration services.

Environment

The environment for the callers are:

Minimum authorization:

Problem state and any PSW key

Dispatchable unit mode:

Task

Cross memory mode:

PASN=HASN=SASN

AMODE:

31-bit

ASC mode:

Primary

Interrupt Status:

Enabled for I/O and external interrupts

Locks:

No locks may be held.

Control parameters:

Control parameters must be in the primary address space.

Programming Requirements

- If you are coding in assembler, include mapping macro IFAEDIDF. It provides return code equates for the various services and mappings for the output from the Query_Status service and the List_Status service. For a description of IFAEDIDF, see *z/OS MVS Data Areas* in the *z/OS Internet library* (www.ibm.com/servers/resourcelink/svc00100.nsf/pages/zosInternetLibrary).
- If you are coding in C, include file IFAEDC provides data definitions for the various services. For a description of IFAEDC, see “IFAEDC” on page 24.
- If you are coding in Java, use the methods in the IFAEDJReg class. See “Registering and deregistering a product using Java ” on page 34 for more information.

Restrictions

- The caller cannot have an established FRR.
- An unauthorized caller of the Register service cannot register if there are already 10 successful registrations (counting all products) made by unauthorized callers from that address space.
- An unauthorized caller cannot deregister a product that was registered by an authorized caller.

- An unauthorized caller cannot deregister a product that was registered from another address space.

Input Register Information

Before issuing any registration service, the caller does not have to place any information into any register unless using it in register notation for a particular parameter, or using it as a base register.

Output Register Information

When control returns to the caller, the general purpose registers (GPRs) contain:

Register Contents

0-1

Used as work registers by the system

2-13

Unchanged

14-15

Used as work registers by the system

When control returns to the caller, the ARs contain:

Register Contents

0-1

Used as work registers by the system

2-13

Unchanged

14-15

Used as work registers by the system

Some callers depend on register contents remaining the same before and after issuing a service. If the system changes the contents of register on which the caller depends, the caller must save them before issuing the service, and restore them after the system returns control.

Performance Implications

These services should not be used in a performance-sensitive environment.

ABEND Codes

Callers of the registration services might encounter the following ABEND codes:

0C4

Meaning: The system cannot properly access a user-provided parameter.

B78

Meaning: The caller was not enabled for I/O and external interrupts.

Register Service (IFAEDREG)

Use the Register service (IFAEDREG) to register a product with MVS. You can register a product or a unique product/feature combination. When you register a product with MVS, you indicate that the registered product is running on the system.

The Register service returns information to the caller and also maintains information that other callers can query to determine if products are registered (running) and enabled on the system.

If the product is an optional z/OS element, feature, or element/feature combination, MVS can also determine whether the element is enabled on this system.

To determine enablement, the system matches the product identified in the call against the policy statements in parmlib member IFAPRDxx.

It is possible, because of wildcard characters (?) and (*) in the policy statements, that multiple policy statements might match the given input product. In that case, MVS uses the "best" match to determine whether or not the product is enabled, using the following rules:

1. An exact match is better than a wildcard match. There is no differentiation between two wildcard matches.
2. The parameters are processed in the following order: Prodowner, ProdID, Prodname, Featurename, Prodvers, Prodrel, and Prodmod. An exact match on a parameter earlier in the list (such as Prodowner) is better than a match on a parameter later in the list (such as Prodname).
3. If, after applying the first two rules, more than one match remains, MVS uses the first match of those that remain.

If product code is neither in supervisor state nor running under a system key, it cannot issue more than 10 register requests.

Syntax

```
CALL IFAEDREG,          (Type
                        ,Prodowner
                        ,Prodname
                        ,Featurename
                        ,Prodvers
                        ,Prodrel
                        ,Prodmod
                        ,ProdID
                        ,Featureslen
                        ,Features
                        ,Prodtoken
                        ,Returncode)
```

In C: the syntax is similar. You can use either of the following techniques to invoke the service:

1. `ifaedreg (Type,...Returncode);`

When you use this technique, you must link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB.

2. `ifaedreg_byaddr (Type,...Returncode);`

This second technique requires AMODE=31, and, before you issue the CALL, you must verify that the IFAEDREG service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

In Assembler: Link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB unless you use either of the following techniques as an alternative to CALL IFAEDREG:

1.

```
LOAD EP=IFAEDREG
Save the entry point address
...
Put the saved entry point address into R15
Issue CALL (15),...
```
2.

```
L    15,X'10'           Get CVT
L    15,X'8C'(.15)      Get ECVT
L    15,X'1C0'(.15)
L    15,4(.15)
L    15,0(.15)          Get address of IFAEDREG
CALL (15),(...)
```

Both of these techniques require AMODE=31. If you use the second technique, before you issue the CALL, you must verify that the IFAEDDRG service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

In Java: Use the methods in the IFAEDJReg class. Prior to invoking your application, the ifaedjreg.jar file must be available on the application's classpath and the registration native library must be available on the application's libpath. See “Registering and deregistering a product using Java ” on page 34 for more information.

Parameters

Type

Supplied parameter:

- Type: Integer
- Length: Full word

Type identifies the type of register request. The field must contain a value that represents one or more of the possible types. You add the values to create the full word. Do not specify a type more than once. The possible types, and their meanings, are:

Ifaedreg_Type_Standard

The system is to register the product, check the enablement policy, and issue a successful return code unless the product is explicitly disabled in the policy. If the product is explicitly disabled, the system does not register the product and does issue return code 4. If you want the service to issue return code 4 (Ifaedreg_Disabled) when the product is not found in the policy, specify Ifaedreg_Type_NotFoundDisabled.

Ifaedreg_Type_Required

The system is to register the product but not check the enablement policy. Use this option when registering solely for status queries. Because the system does not check the enablement policy, you cannot get return code 4 (Ifaedreg_Disabled).

Ifaedreg_Type_NoReport

The system is to register the product but not report the product in the software registration report or the response to a DISPLAY command (unless the command specifies ALL). You might use this option when registering solely for status queries. Because the system does not check the enablement policy, you cannot get return code 4 (Ifaedreg_Disabled).

Ifaedreg_Type_LicensedUnderProd

The system is to register the product/feature combination, but the product/feature combination cannot be ordered separately. The software registration report will differentiate this type of registration from others; a person looking at the report can easily tell that there is no need to check the ordering information for this product/featurename combination.

Ifaedreg_Type_DisabledMessage

The system, if it finds the product to be disabled, is to issue message IFA104I, described in *z/OS MVS System Messages, Vol 8 (IEF-IGD)*. Thus, the caller does not have to issue the message. The system issues message IFA104I with no console ID specified, and with routing codes 10 (System/Error Maintenance) and 11 (Programmer Information).

Ifaedreg_Type_NotFoundDisabled

The system, if it does not find the product in the enablement policy, is to treat the product as disabled rather than enabled. That is, if the product is not found, the system does not register the product and does issue return code 4 (Ifaedreg_Disabled). If you also specify Ifaedreg_Type_DisabledMessage, the system issues message IFA104I. For a description of this message, see *z/OS MVS System Messages, Vol 8 (IEF-IGD)*.

,Prodowner

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Prodowner specifies the name of the product owner (vendor). IBM products, for example, always use IBM CORP or IBM_CORP.

The characters can be upper-case or lower-case alphabets, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Prodname

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Prodname specifies the name of the product.

The characters can be upper-case or lower-case alphabets, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Featurename

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Featurename specifies the name of the feature within the product or blanks if there is no feature name.

The characters can be upper-case or lower-case alphabets, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Prodvers

Supplied parameter:

- Type: EBCDIC
- Length: 2 bytes

Prodvers specifies the product version identification or blanks if there is no version identification.

The characters can be upper-case or lower-case alphabets and numerics. You can use embedded blanks.

The system performs all comparisons in upper case.

If the version identification is less than 2 bytes, left-justify it in the field and pad it on the right with EBCDIC blanks.

,Prodrel

Supplied parameter:

- Type: EBCDIC
- Length: 2 bytes

Prodrel specifies the product release identification or blanks if there is no release identification.

The characters can be upper-case or lower-case alphabetics and numerics. You can use embedded blanks.

The system performs all comparisons in upper case.

If the release identification is less than 2 bytes, left-justify it in the field and pad it on the right with EBCDIC blanks.

,Prodmod

Supplied parameter:

- Type: EBCDIC
- Length: 2 bytes

Prodmod specifies the product modification level or blanks if there is no modification level.

The characters can be upper-case or lower-case alphabetics and numerics. You can use embedded blanks.

The system performs all comparisons in upper case.

If the modification level is less than 2 bytes, left-justify it in the field and pad it on the right with EBCDIC blanks.

,ProdID

Supplied parameter:

- Type: EBCDIC
- Length: 8 bytes

ProdID specifies the product identifier. IBM products, for example, use the product's program number.

The characters can be upper-case or lower-case alphabetics, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 8 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Featureslen

Supplied parameter:

- Type: Integer
- Range: 0-1024
- Length: Full word

Featureslen specifies the length of the features parameter that follows.

,Features

Supplied parameter:

- Type: Character (EBCDIC recommended)
- Length: 1-1024 bytes

Features contains any information that you want the system to pass to the caller of the Query_Status service. (Featureslen specifies the length of the information.)

If you do not need to pass information to callers of the Query_Status service, code 0 in the Featureslen parameter. The system then ignores the contents of the Features parameter, but the service syntax requires that you supply a value.

If you do need to pass information to the callers of Query_Status, using EBCDIC can simplify the parsing requirements for the caller, but you do need to provide a mapping of the information for the caller to use. An alternate approach is to set up self-defining features information (such as

feature1=value1,feature2=value2, . . .). This approach has the advantage of simplicity, but does use more system (common) storage.

If the product you are registering is already registered, the features information you specify here will replace the features information provided on any previous call, but only for the length provided on the previous call. For example, if the previous call specified a Featureslen of 16, and this call specifies 32, the system uses only the first 16 bytes of features information from this call.

,Prodtoken

Returned parameter:

- Type: Character
- Length: 8 bytes

Prodtoken contains the token the system returns to identify this particular registration. Save this token to supply as input to the Deregister service.

,Returncode

Returned parameter:

- Type: Integer
- Length: Full word

Returncode contains the return code from the Register service.

Return Codes

When the Register service returns control to the caller, Returncode contains the return code. To obtain the equates for the return codes:

- If you are coding in assembler, include mapping macro IFAEDIDF. See *z/OS MVS Data Areas* in the *z/OS Internet library* (www.ibm.com/servers/resourcelink/svc00100.nsf/pages/zosInternetLibrary).
- If you are coding in C, use include file IFAEDC. See “IFAEDC” on page 24.

The following table describes the return codes, shown in decimal.

Return Code (decimal)	Equate Symbol Meaning and Action
00	<p>Equate Symbol: IFAEDREG_SUCCESS</p> <p>Meaning: The product/feature combination is enabled and is permitted to execute. Note that, unless you request option Ifaedreg_Type_NotFoundDisabled, you will get this return code when the system does not find a policy statement that matches the product.</p> <p>Action: Proceed with normal execution.</p>
04	<p>Equate Symbol: IFAEDREG_DISABLED</p> <p>Meaning: The product/feature combination is not enabled; it is explicitly disabled and is not permitted to execute. To get this return code when the system does not find a policy statement that matches the product, you must also request option Ifaedreg_Type_NotFoundDisabled.</p> <p>Action:</p> <ol style="list-style-type: none"> 1. Write the appropriate termination message to the terminal or log, unless the operator message issued because you requested Ifaedreg_Type_DisabledMessage provides enough information. 2. Set a return code to indicate termination for ‘not ordered or not permitted to run’ condition. 3. Terminate requestor's use of program.

Return Code (decimal)	Equate Symbol Meaning and Action
08	<p>Equate Symbol: IFAEDREG_NOTAVAILABLE</p> <p>Meaning: Environmental error: The Register service is not available on this system.</p> <p>Action:</p> <ul style="list-style-type: none"> • If this version of the program must execute on a system that provides registration services: <ol style="list-style-type: none"> 1. Write the appropriate termination message to the terminal or log. 2. Set a return code to indicate termination because registration services are not available on this system. 3. Terminate requestor's use of program. • If this version of the program does not need to execute on a system that provides registration services, take the actions appropriate for the product/feature when you cannot determine if it is enabled.
12	<p>Equate Symbol: IFAEDREG_LIMITEXCEEDED</p> <p>Meaning: Environmental error: This request exceeds the limit of 10 register requests by an unauthorized caller in this address space.</p> <p>Action: Use the Deregister service to remove unneeded registrations.</p>
16	<p>Equate Symbol: IFAEDREG_NOTTASKMODE</p> <p>Meaning: User error: The service was not called in task mode.</p> <p>Action: Avoid calling in this environment.</p>
20	<p>Equate Symbol: IFAEDREG_XM</p> <p>Meaning: User error: The service was called in cross-memory mode but requires PASN=HASN=SASN.</p> <p>Action: Avoid calling in this environment.</p>
24	<p>Equate Symbol: IFAEDREG_BADFEATURESLEN</p> <p>Meaning: User error: The Featureslen parameter was not in the range 0-1024.</p> <p>Action: Correct the parameter.</p>
28	<p>Equate Symbol: IFAEDREG_NOSTORAGE</p> <p>Meaning: Environmental error: The system could not obtain the storage it needed to satisfy the request.</p> <p>Action: Contact the system programmer.</p>
32	<p>Equate Symbol: IFAEDREG_BADTYPE</p> <p>Meaning: User error: The type parameter did not specify a word formed from any combination of Ifaedreg_Type_Standard, Ifaedreg_Type_Required, Ifaedreg_Type_NoReport, Ifaedreg_Type_LicensedUnderProd, Ifaedreg_Type_DisabledMessage, and Ifaedreg_Type_NotFoundDisabled.</p> <p>Action: Correct the parameter.</p>

Return Code (decimal)	Equate Symbol Meaning and Action
36	Equate Symbol: IFAEDREG_LOCKED Meaning: User error: The service was called while holding a system lock. Action: Avoid calling in this environment.
40	Equate Symbol: IFAEDREG_FRR Meaning: User error: The service was called while having a functional recovery routine (FRR) established. Action: Avoid calling in this environment.

Deregister Service (IFAEDDRG)

Use the Deregister service (IFAEDDRG) to indicate that a registered product or product/feature combination is ending its processing. When a product registers with MVS, it indicates that it is running on the system. When it ends, the product issues the Deregister service to indicate that it has finished processing.

A product that issues the Register service receives a token that identifies the unique instance of the product. To deregister, the product calls the Deregister service and supplies the token. Note that the system automatically deregisters the product on termination of:

- The cross-memory resource owning task (TCB address in ASCBXTCB) that was active when the register request was done
- The address space that was the home address space when the register request was done.

If the product code is neither in supervisor state nor running under a system key, there are limitations on the use of Deregister:

1. You cannot deregister a product that was registered by a caller in supervisor state or running under a system key.
2. You can deregister only a product that was registered from your home address space.

Syntax

CALL IFAEDDRG,	(Prodtoken ,Returncode)
----------------	----------------------------

In C: the syntax is similar. You can use either of the following techniques to invoke the service:

1. `ifaeddrg (Type,...Returncode);`

When you use this technique, you must link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB.

2. `ifaeddrg_byaddr (Type,...Returncode);`

This second technique requires AMODE=31, and, before you issue the CALL, you must verify that the IFAEDDRG service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

Deregister Service (IFAEDDRG)

In Assembler: Link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB unless you use either of the following techniques as an alternative to CALL IFAEDDRG:

```
1.  LOAD EP=IFAEDDRG
    Save the entry point address
    ...
    Put the saved entry point address into R15
    Issue CALL (15),...

2.  L    15,X'10'           Get CVT
    L    15,X'8C'(',15)      Get ECVT
    L    15,X'1C0'(',15)
    L    15,4(',15)
    L    15,4(',15)          Get address of IFAEDDRG
    CALL (15),(...)
```

Both of these techniques require AMODE=31. If you use the second technique, before you issue the CALL, you must verify that the IFAEDDRG service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

In Java: Use the methods in the IFAEDJReg class. Prior to invoking your application, the ifaedjreg.jar file must be available on the application's classpath and the registration native library must be available on the application's libpath. See [“Registering and deregistering a product using Java”](#) on page 34 for more information.

Parameters

Prodtoken

Supplied parameter:

- Type: Character
- Length: 8 bytes

Prodtoken contains the token the system returned when the product issued the Register service.

,Returncode

Returned parameter:

- Type: Integer
- Length: Full word

Returncode contains the return code from the Deregister service.

Return Codes

When the Deregister service returns control to the caller, Returncode contains the return code. To obtain the equates for the return codes:

- If you are coding in assembler, include mapping macro IFAEDIDF. See *z/OS MVS Data Areas* in the *z/OS Internet library* (www.ibm.com/servers/resourcelink/svc00100.nsf/pages/zosInternetLibrary).
- If you are coding in C, use the include file IFAEDC. See [“IFAEDC”](#) on page 24.

The following table describes the return codes, shown in decimal.

Return Code (decimal)	Equate Symbol Meaning and Action
00	Equate Symbol: IFAEDDRG_SUCCESS Meaning: The product/feature combination has been deregistered. Action: No action is required.

Return Code (decimal)	Equate Symbol Meaning and Action
08	Equate Symbol: IFAEDDRG_NOTAVAILABLE Meaning: Environmental error: The Deregister service is not available on this system. Action: Avoid calling the Deregister service on this system.
12	Equate Symbol: IFAEDDRG_NOTREGISTERED Meaning: User error: The product identified by the Prodtoken parameter was not registered. Action: In Prodtoken, provide a correct product token, as returned by the Register service.
16	Equate Symbol: IFAEDDRG_NOTTASKMODE Meaning: User error: The service was not called in task mode. Action: Avoid calling in this environment.
20	Equate Symbol: IFAEDDRG_XM Meaning: User error: The service was called in cross-memory mode but requires PASN=HASN=SASN. Action: Avoid calling in this environment.
24	Equate Symbol: IFAEDDRG_NOTAUTH Meaning: User error: A caller running in problem state tried to deregister a product that had been registered by an authorized caller (a program running in supervisor state or under a system key). Action: Avoid trying to deregister a product registered by an authorized caller.
36	Equate Symbol: IFAEDDRG_LOCKED Meaning: User error: The service was called while holding a system lock. Action: Avoid calling in this environment.
40	Equate Symbol: IFAEDDRG_FRR Meaning: User error: The service was called while having a functional recovery routine (FRR) established. Action: Avoid calling in this environment.

Query_Status Service (IFAEDSTA)

Use the Query_Status service (IFAEDSTA) to request information about the registration or enablement status of a particular product. The system will indicate, through a combination of return code value and output area content:

- If the product is registered (running)
- If the product is enabled

When it searches for the product you identify, the system does not use wildcard matching; there is no special treatment for a wildcard character (* or ?). You can, however, indicate fields that are not important to your search, and the system will try to find the best match it can for the parameters that you provide. If two matches are equivalently good, and one of them contains a registration from the current home address space, then that match is used.

Syntax

```
CALL IFAEDSTA
                                (Prodowner
                                ,Prodname
                                ,Featurename
                                ,ProdID
                                ,Outputinfo
                                ,Featureslen
                                ,Features
                                ,Returncode)
```

In C: the syntax is similar. You can use either of the following techniques to invoke the service:

```
1. ifaedsta (Type,...Returncode);
```

When you use this technique, you must link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB.

```
2. ifaedsta_byaddr (Type,...Returncode);
```

This second technique requires AMODE=31, and, before you issue the CALL, you must verify that the IFAEDSTA service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

In Assembler: Link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB unless you use either of the following techniques as an alternative to CALL IFAEDSTA:

```
1.  LOAD EP=IFAEDSTA
    Save the entry point address
    ...
    Put the saved entry point address into R15
    Issue CALL (15),...

2.  L   15,X'10'                Get CVT
    L   15,X'8C'(. ,15)         Get ECVT
    L   15,X'1C0'(. ,15)
    L   15,4(. ,15)
    L   15,8(. ,15)             Get address of IFAEDSTA
    CALL (15),(...)
```

Both of these techniques require AMODE=31. If you use the second technique, before you issue the CALL, you must verify that the IFAEDDRG service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

Note: This service is not available in Java.

Parameters

,Prodowner

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Specifies the name of the product owner you are searching for. IBM products always use IBM CORP or IBM_CORP. If the product owner is not important to your search, set the first character of the field to an EBCDIC blank or hexadecimal zeroes.

The characters can be upper-case or lower-case alphabetics, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Prodname

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Specifies the name of the product you are searching for. If the product name is not important to your search, set the first character of the field to EBCDIC blank or hexadecimal zeroes.

The characters can be upper-case or lower-case alphabetics, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Featurename

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Specifies the name of the feature you are searching for. If the feature name is not important to your search, set the first character of the field to EBCDIC blank or hexadecimal zeroes.

The characters can be upper-case or lower-case alphabetics, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,ProdID

Supplied parameter:

- Type: EBCDIC
- Length: 8 bytes

ProdID specifies the product identifier you are searching for. IBM products use the product's program number as the product identifier. If the product identifier is not important to your search, set the first character of the field to EBCDIC blank or hexadecimal zeroes.

The characters can be upper-case or lower-case alphabetics, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), and period (.). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the name is less than 8 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Outputinfo

Returned parameter:

- Type: Character
- Length: 16

Specifies an output area, mapped by DSECT EDOI (in mapping macro IFAEDIDF) or structure EDOI (in C include file IFAEDC). If the return code is 0, this area contains information about the product you defined.

,Featureslen

Supplied parameter:

- Type: Integer
- Range: 0-1024
- Length: Full word

Featureslen specifies the length of the Features parameter that follows.

,Features

Returned parameter:

- Type: Character (EBCDIC recommended)
- Length: 1-1024 bytes

Features contains information provided by the caller of the Register service, and you need documentation from that caller about the length, format, and use of the information.

If the information is larger than the length you specify in Featureslen, the system returns only the information that fits in the area you provide. In that case, bit EdoiNotAllFeaturesReturned and field EdoiNeededFeaturesLen are set in the outputinfo area. You can use the length to call the Query_Status service again with an expanded area.

If you are not expecting any information from the caller of the Register service, code 0 in the Featureslen parameter. This system will then ignore the Features parameter, but the service syntax requires that you supply a value.

,Returncode

Returned parameter:

- Type: Integer
- Length: Full word

Returncode contains the return code from the Query_Status service.

Return Codes

When the Query_Status service returns control to the caller, Returncode contains the return code. To obtain the equates for the return codes:

- If you are coding in assembler, include mapping macro IFAEDIDF. See *z/OS MVS Data Areas* in the [z/OS Internet library \(www.ibm.com/servers/resourcelink/svc00100.nsf/pages/zosInternetLibrary\)](http://www.ibm.com/servers/resourcelink/svc00100.nsf/pages/zosInternetLibrary).
- If you are coding in C, use the include file IFAEDC. See “IFAEDC” on page 24.

The following table describes the return codes, shown in decimal.

Return Code (decimal)	Equate Symbol Meaning and Action
00	<p>Equate Symbol: IFAEDSTA_SUCCESS</p> <p>Meaning: The product/feature combination is known to be registered or to be enabled or disabled.</p> <p>Action: Check the outputinfo area for further information.</p>

Return Code (decimal)	Equate Symbol Meaning and Action
04	Equate Symbol: IFAEDSTA_NOTDEFINED Meaning: The product/feature combination is not known to be registered or to be enabled or disabled. Action: Check that the operands are correct.
08	Equate Symbol: IFAEDSTA_NOTAVAILABLE Meaning: Environmental error: The Status service is not available on this system. Action: Avoid calling the Status service on this system.
16	Equate Symbol: IFAEDSTA_NOTTASKMODE Meaning: User error: The service was not called in task mode. Action: Avoid calling in this environment.
20	Equate Symbol: IFAEDSTA_XM Meaning: User error: The service was called in cross-memory mode but requires HASN=PASN=SASN. Action: Avoid calling in this environment.
36	Equate Symbol: IFAEDSTA_LOCKED Meaning: User error: The service was called while holding a system lock. Action: Avoid calling in this environment.
40	Equate Symbol: IFAEDSTA_FRR Meaning: User error: The service was called while having a functional recovery routine (FRR) established. Action: Avoid calling in this environment.

List_Status Service (IFAEDLIS)

Use the List_Status service (IFAEDLIS) to request information about the registration and enablement of one or more products. The system returns information about the products that match the product definition you supply.

You can also use the List_Status service to determine what, according to the current policy, the enablement state would be for the product you define. You might use this service to determine whether or not registering the product would require a change to the enablement policy in IFAPRDxx.

The system returns the information in the answer area you specify on the List_Status request:

- In assembler language, the answer area is mapped by DSECTs EDAAHDR and EDAAE in mapping macro IFAEDIDF.
- In C language, the answer area is mapped by structures EDAAHDR and EDAAE in include file IFAEDC.

EDAAHDR maps information about the request, including the number of entries returned. EDAAE maps each returned entry.

Syntax

```
CALL IFAEDLIS,                (Type
                              ,Prodowner
                              ,Prodname
                              ,Featurename
                              ,ProdID
                              ,Anslen
                              ,Ansarea
                              ,Returncode)
```

In C: the syntax is similar. You can use either of the following techniques to invoke the service:

```
1. ifaedlis (Type,...Returncode);
```

When you use this technique, you must link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB.

```
2. ifaedlis_byaddr (Type,...Returncode);
```

This second technique requires AMODE=31, and, before you issue the CALL, you must verify that the IFAEDLIS service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

In Assembler: Link edit your program with a linkage-assist routine (also called a stub) in SYS1.CSSLIB unless you use either of the following techniques as an alternative to CALL IFAEDLIS:

```
1.  LOAD EP=IFAEDLIS
    Save the entry point address
    ...
    Put the saved entry point address into R15
    Issue CALL (15),...

2.  L   15,X'10'                Get CVT
    L   15,X'8C'(:,15)          Get ECVT
    L   15,X'1C0'(:,15)
    L   15,4(:,15)
    L   15,12(:,15)             Get address of IFAEDLIS
    CALL (15),(...)
```

Both of these techniques require AMODE=31. If you use the second technique, before you issue the CALL, you must verify that the IFAEDDRG service is available (in the CVT, both CVTOSEXT and CVTOS390 bits are set on).

Note: This service is not available in Java.

Parameters

Type

Supplied parameter:

- Type: Integer
- Length: Full word

Identifies the type of list request. The field must contain a value that represents a combination of one or more of the possible types. You add the values to create the full word. Do not specify a type more than once. The possible types, and their meanings, are:

Ifaedlis_Type_Registered

The system is to return data about any matching products that are registered. The number of entries returned appears in field EdaahNumR in the answer area. The address of the first entry appears in field EdaahFirstRAddr. DSECT EDAAE maps each entry. If you specify * or ? in the product definition, the system treats the character as a wildcard character.

Ifaedlis_Type_State

The system is to return data about the current policy state (enabled or disabled) of any matching products. The number of entries returned appears in field EdaahNumS. The address of the first entry appears in field EdaahFirstSAddr. DSECT EDAAE maps each entry. If you specify * or ? in the product definition, the system treats the character as a wildcard character.

Ifaedlis_Type_Status

The system is to return data about the enablement policy entry that would apply if the specified product registered. If there is no matching entry, the system sets Field EdaahStatusAddr in the answer area to 0; otherwise, it contains the address of the entry (mapped by DSECT EDAAE).

Note: For this request type, the system does not use wildcard matching when it searches the policy. If you specify * or ? in the product definition, the system does not treat the character as a wildcard character. To indicate that a field is not important, however, you can set the first character of the field to an EBCDIC blank or hexadecimal zeroes.

Ifaedlis_Type_NoReport

Specify this request type to indicate the system is to return information about all matching entries, including those that registered with **Ifaedreg_Type_NoReport**.

,Prodowner

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Specifies the name of the product owner you are searching for. IBM products always use IBM CORP or IBM_CORP.

The characters can be upper-case or lower-case alphabets, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), period (.), asterisk (*), or question mark (?). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the request specifies **Ifaedlis_Type_Registered** or **Ifaedlis_Type_State**, the system treats * and ? as wildcard characters; it uses wildcard matching. When you specify **Ifaedlis_Type_Status**, the system does not use wildcard matching, and * or ? receive no special treatment. If the product owner is not important to your search, set the first character of the field to an EBCDIC blank or hexadecimal zeroes.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Prodname

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Specifies the name of the product you are searching for.

The characters can be upper-case or lower-case alphabets, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), period (.), asterisk (*), or question mark (?). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the request specifies **Ifaedlis_Type_Registered** or **Ifaedlis_Type_State**, the system treats * and ? as wildcard characters; it uses wildcard matching. When you specify **Ifaedlis_Type_Status**, the

system does not use wildcard matching, and * or ? receive no special treatment. If the product name is not important to your search, set the first character of the field to an EBCDIC blank or hexadecimal zeroes.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Featurename

Supplied parameter:

- Type: EBCDIC
- Length: 16 bytes

Specifies the name of the feature you are searching for.

The characters can be upper-case or lower-case alphabets, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), period (.), asterisk (*), or question mark (?). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the request specifies **Ifaedlis_Type_Registered** or **Ifaedlis_Type_State**, the system treats * and ? as wildcard characters; it uses wildcard matching. When you specify **Ifaedlis_Type_Status**, the system does not use wildcard matching, and * or ? receive no special treatment. If the feature name is not important to your search, set the first character of the field to an EBCDIC blank or hexadecimal zeroes.

If the name is less than 16 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,ProdID

Supplied parameter:

- Type: EBCDIC
- Length: 8 bytes

ProdID specifies the product identifier you are searching for. IBM products, for example, use the product's program number as the product identifier.

The characters can be upper-case or lower-case alphabets, numerics, national (@, #, \$), underscore (_), slash (/), hyphen (-), period (.), asterisk (*), or question mark (?). You can use embedded blanks.

The system translates underscores to blanks for comparison and display, and it performs all comparisons in upper case.

If the request specifies **Ifaedlis_Type_Registered** or **Ifaedlis_Type_State**, the system treats * and ? as wildcard characters; it uses wildcard matching. When you specify **Ifaedlis_Type_Status**, the system does not use wildcard matching, and * or ? receive no special treatment. If the product identifier is not important to your search, set the first character of the field to an EBCDIC blank or hexadecimal zeroes.

If the name is less than 8 bytes, left-justify the name in the field and pad it on the right with EBCDIC blanks.

,Anslen

Supplied parameter:

- Type: Integer
- Minimum Value: 32
- Length: Full word

Specifies the length of the answer area parameter that follows. Specify a value of at least 32, the length of the answer area header (DSECT EDAAHDR in macro IFAEDIDF) that the system returns. Add 72 for each entry that you expect the system to return.

,Ansarea

Returned parameter:

- Type: Character
- Length: Specified on **Anslen** parameter

The answer area where the system is to place information about the request and the entries that match the product definition. The contents depend on the type of the request:

- If you specified **Ifaedlis_Type_Registered**, the answer area consists of a header area and a queue of 0 or more entries. The number of entries is in EDAAHNUMR, and EDAAHFIRSTRADDR points to the first entry. If you did not specify **Ifaedlis_Type_Registered**, both fields are 0.
- If you specified **Ifaedlis_Type_State**, the answer area consists of a header area and a queue of 0 or more entries. The number of entries is in EDAAHNUMS, and EDAAHFIRSTSADDR points to the first entry. If you did not specify **Ifaedlis_Type_State**, both fields are 0.
- If you specified **Ifaedlis_Type_Status**, the answer area consists of a header area and a single entry. EDAAHSTATUSADDR points to an entry that defines the policy that would be used to determine whether the product is enabled or disabled. The field is 0 if there is no matching policy entry, and it is always 0 when you did not specify **Ifaedlis_Type_Status**.

If the returned information exceeds the length you specify in Anslen, the system returns only the information that fits in the area you provided. EDAAHTLEN indicates the total length of the information available to be returned. If the length is longer than the length you specified in Anslen, increase Anslen and issue the request again.

,Returncode

Returned parameter:

- Type: Integer
- Length: Full word

Returncode contains the return code from the List_Status service.

Return Codes

When the List_Status service returns control to the caller, Returncode contains the return code. To obtain the equates for the return codes:

- If you are coding in assembler, include mapping macro IFAEDIDF. See *z/OS MVS Data Areas* in the [z/OS Internet library](http://www.ibm.com/servers/resourcelink/svc00100.nsf/pages/zosInternetLibrary) (www.ibm.com/servers/resourcelink/svc00100.nsf/pages/zosInternetLibrary).
- If you are coding in C, use the include file IFAEDC. See “IFAEDC” on page 24.

The following table describes the return codes, shown in decimal.

Return Code (decimal)	Equate Symbol Meaning and Action
00	Equate Symbol: IFAEDLIS_SUCCESS Meaning: The system returned all the requested data. Action: No action is required.
04	Equate Symbol: IFAEDLIS_NOTALLDATARETURNED Meaning: The answer area was too small. Some of the requested data was not returned. Action: Provide a larger answer area and call the service again.

Return Code (decimal)	Equate Symbol Meaning and Action
08	Equate Symbol: IFAEDLIS_NOTAVAILABLE Meaning: Environmental error: The IFAEDLIS service is not available on this system. Action: Avoid calling the IFAEDLIS service on this system.
12	Equate Symbol: IFAEDLIS_ANSAREATOOSMALL Meaning: User error: The answer area length you provided was less than the minimum needed, 32. Action: Provide a larger answer area.
16	Equate Symbol: IFAEDSTA_NOTTASKMODE Meaning: User error: The service was not called in task mode. Action: Avoid calling in this environment.
20	Equate Symbol: IFAEDLIS_XM Meaning: User error: The service was called in cross-memory mode but requires PASN=HASN=SASN. Action: Avoid calling in this environment.
32	Equate Symbol: IFAEDLIS_BADTYPE Meaning: User error: The type parameter did not specify a word formed from any combination of Ifaedlis_Type_Registered, Ifaedlis_Type_State, Ifaedlis_Type_Status, and Ifaedlis_Type_Noreport. Action: Correct the parameter.
36	Equate Symbol: IFAEDLIS_LOCKED Meaning: User error: The service was called while holding a system lock. Action: Avoid calling in this environment.
40	Equate Symbol: IFAEDLIS_FRR Meaning: User error: The service was called while having a functional recovery routine (FRR) established. Action: Avoid calling in this environment.

IFAEDC

For the C programmer, include file IFAEDC provides equates for return codes and data constants, such as Register service request types. To use IFAEDC, copy the file from SYS1.SAMPLIB to the appropriate local C library. The contents of the file are displayed in [Figure 2 on page 25](#).

```

#ifndef __IFAEDC

/*
/* Function:
 * IFAEDC defines types, related constants, and function
 * prototypes for the use of SMF Product enable/disable services
 * from the C language
 *
 * Usage:
 * #include <IFAEDC.H>
 *
 * Notes:
 * 1. This member should be copied from SAMPLIB to the
 * appropriate local C library.
 *
 * 2. The Product enable/disable services do not use a null
 * character to terminate strings. The services expect the
 * character operands to be a fixed-length type.
 * Use memcpy to move into and from these fields.
 *
 * Change Activity:
 * $L0=PRDEDSMF,HBB6601, 950601, PDXB: SMF Product enable/disable
 *

Chapter 3. Examples

The following examples show possible uses of the registration services. The examples are written in assembler and Java.

Detailed information about the services appears in [Chapter 2, “Coding Registration Services,”](#) on page 5.

Registering a product, checking the status of another product, then deregistering the first product using assembler

Figure 3 on page 31 shows code that registers a product, checks the status of another product, then deregisters the first product and uses the MF parameter of the CALL macro to generate reentrant code.

Registering and deregistering a product using Java

The IFAEDJReg class provides access to the z/OS product registration and deregistration services through Java. The IFAEDJReg class allows Java programs to use the product registration services by wrapping the system IFAEDREG (register) and IFAEDDRG (deregister) callable services.

A product is identified through various parameters such as product name, product owner, and feature name. These fields are set in the IFAEDJReg object and then the register method can be called.

After a successful registration, a registration token (also referred to as a product token) is returned by the system. This token is used by the deregister method to deregister the product.

The registration or deregistration return code provided by the system is returned by the methods.

The product registration Java support requires that the following Java level or higher be installed:

- IBM SDK for z/OS Java 2 Technology Edition, Version 1.4 PTF UQ93743, product number 5655-I56

To run an application that uses the product registration Java classes, you must add the jar file containing the product registration classes to your path, and add the native library to your libpath.

Note in the examples below, the default installation paths are shown. If you have changed the default by adding a path prefix, modify the commands accordingly.

Add the /usr/include/java_classes/ifaedjreg.jar file to your application classpath. In the z/OS UNIX System Services shell, this can be done with the command:

```
export CLASSPATH=/usr/include/java_classes/ifaedjreg.jar:$CLASSPATH
```

Add the path to the native library `/usr/lib/java_runtime/libifaedjreg.so` to your library path (LIBPATH). In the z/OS Unix System Services shell, this can be done with the command:

```
export LIBPATH=/usr/lib/java_runtime:$LIBPATH
```

The documentation for the using the methods in the Java classes is contained in the Javadoc for the IFAEDJReg class. The Java doc is installed to `/usr/include/java_classes/ifadregDoc.jar` by default.

All of the Javadoc files for product registration have been included in the jar. To view the Javadoc, it is necessary to download the jar file in binary to your workstation, unjar the file to make the individual files accessible, and then use your browser to open the index.html file.

Example: Registering a product using Java

The product name "TESTPROD" with product owner "IBM" and product number 9999-999 is to be registered. If the product is disabled, the program will exit. Registration is done using the system service IFAEDREG.

```
IFAEDJReg reg = new IFAEDJReg();
reg.setRegisterType(IFAEDJReg.IFAEDREG_TYPE_STANDARD +
IFAEDJReg.IFAEDREG_TYPE_NOTFOUNDDISABLED);
reg.setProductName("TESTPROD");
reg.setProductOwner("IBM");
reg.setProductID("9999-999");
int rc = reg.register(); // Invoke registration service
if (rc != IFAEDJReg.IFAEDREG_SUCCESS) {
    System.out.println("TESTPROD registration failed due to the return code from IFAEDJReg,
rc="+rc);
    System.exit(1);
}
```

Example: Deregistering a product using Java

A previously registered product is to be deregistered. The same object that was used during registration is used for the deregistration. Deregistration is done using the system service IFAEDDRG.

```
int rc = reg.deregister(); // Invoke deregistration service
if (rc != IFAEDJReg.IFAEDDRG_SUCCESS) {
    System.out.println("TESTPROD deregistration failed due to the return code from
IFAEDJReg, rc="+rc);
    System.exit(2);
}
```

Appendix A. Accessibility

Accessible publications for this product are offered through [IBM Documentation \(www.ibm.com/docs/en/zos\)](http://www.ibm.com/docs/en/zos).

If you experience difficulty with the accessibility of any z/OS information, send a detailed message to the [Contact the z/OS team web page \(www.ibm.com/systems/campaignmail/z/zos/contact_z\)](http://www.ibm.com/systems/campaignmail/z/zos/contact_z) or use the following mailing address.

IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
United States

Accessibility features

Accessibility features help users who have physical disabilities such as restricted mobility or limited vision use software products successfully. The accessibility features in z/OS can help users do the following tasks:

- Run assistive technology such as screen readers and screen magnifier software.
- Operate specific or equivalent features by using the keyboard.
- Customize display attributes such as color, contrast, and font size.

Consult assistive technologies

Assistive technology products such as screen readers function with the user interfaces found in z/OS. Consult the product information for the specific assistive technology product that is used to access z/OS interfaces.

Keyboard navigation of the user interface

You can access z/OS user interfaces with TSO/E or ISPF. The following information describes how to use TSO/E and ISPF, including the use of keyboard shortcuts and function keys (PF keys). Each guide includes the default settings for the PF keys.

- *z/OS TSO/E Primer*
- *z/OS TSO/E User's Guide*
- *z/OS ISPF User's Guide Vol I*

Dotted decimal syntax diagrams

Syntax diagrams are provided in dotted decimal format for users who access IBM Documentation with a screen reader. In dotted decimal format, each syntax element is written on a separate line. If two or more syntax elements are always present together (or always absent together), they can appear on the same line because they are considered a single compound syntax element.

Each line starts with a dotted decimal number; for example, 3 or 3.1 or 3.1.1. To hear these numbers correctly, make sure that the screen reader is set to read out punctuation. All the syntax elements that have the same dotted decimal number (for example, all the syntax elements that have the number 3.1)

are mutually exclusive alternatives. If you hear the lines 3.1 USERID and 3.1 SYSTEMID, your syntax can include either USERID or SYSTEMID, but not both.

The dotted decimal numbering level denotes the level of nesting. For example, if a syntax element with dotted decimal number 3 is followed by a series of syntax elements with dotted decimal number 3.1, all the syntax elements numbered 3.1 are subordinate to the syntax element numbered 3.

Certain words and symbols are used next to the dotted decimal numbers to add information about the syntax elements. Occasionally, these words and symbols might occur at the beginning of the element itself. For ease of identification, if the word or symbol is a part of the syntax element, it is preceded by the backslash (\) character. The * symbol is placed next to a dotted decimal number to indicate that the syntax element repeats. For example, syntax element *FILE with dotted decimal number 3 is given the format 3 * FILE. Format 3* FILE indicates that syntax element FILE repeats. Format 3* * FILE indicates that syntax element * FILE repeats.

Characters such as commas, which are used to separate a string of syntax elements, are shown in the syntax just before the items they separate. These characters can appear on the same line as each item, or on a separate line with the same dotted decimal number as the relevant items. The line can also show another symbol to provide information about the syntax elements. For example, the lines 5.1*, 5.1 LASTRUN, and 5.1 DELETE mean that if you use more than one of the LASTRUN and DELETE syntax elements, the elements must be separated by a comma. If no separator is given, assume that you use a blank to separate each syntax element.

If a syntax element is preceded by the % symbol, it indicates a reference that is defined elsewhere. The string that follows the % symbol is the name of a syntax fragment rather than a literal. For example, the line 2.1 %OP1 means that you must refer to separate syntax fragment OP1.

The following symbols are used next to the dotted decimal numbers.

? indicates an optional syntax element

The question mark (?) symbol indicates an optional syntax element. A dotted decimal number followed by the question mark symbol (?) indicates that all the syntax elements with a corresponding dotted decimal number, and any subordinate syntax elements, are optional. If there is only one syntax element with a dotted decimal number, the ? symbol is displayed on the same line as the syntax element, (for example 5? NOTIFY). If there is more than one syntax element with a dotted decimal number, the ? symbol is displayed on a line by itself, followed by the syntax elements that are optional. For example, if you hear the lines 5 ?, 5 NOTIFY, and 5 UPDATE, you know that the syntax elements NOTIFY and UPDATE are optional. That is, you can choose one or none of them. The ? symbol is equivalent to a bypass line in a railroad diagram.

! indicates a default syntax element

The exclamation mark (!) symbol indicates a default syntax element. A dotted decimal number followed by the ! symbol and a syntax element indicate that the syntax element is the default option for all syntax elements that share the same dotted decimal number. Only one of the syntax elements that share the dotted decimal number can specify the ! symbol. For example, if you hear the lines 2? FILE, 2.1! (KEEP), and 2.1 (DELETE), you know that (KEEP) is the default option for the FILE keyword. In the example, if you include the FILE keyword, but do not specify an option, the default option KEEP is applied. A default option also applies to the next higher dotted decimal number. In this example, if the FILE keyword is omitted, the default FILE (KEEP) is used. However, if you hear the lines 2? FILE, 2.1, 2.1.1! (KEEP), and 2.1.1 (DELETE), the default option KEEP applies only to the next higher dotted decimal number, 2.1 (which does not have an associated keyword), and does not apply to 2? FILE. Nothing is used if the keyword FILE is omitted.

*** indicates an optional syntax element that is repeatable**

The asterisk or glyph (*) symbol indicates a syntax element that can be repeated zero or more times. A dotted decimal number followed by the * symbol indicates that this syntax element can be used zero or more times; that is, it is optional and can be repeated. For example, if you hear the line 5.1* data area, you know that you can include one data area, more than one data area, or no data area. If you hear the lines 3* , 3 HOST, 3 STATE, you know that you can include HOST, STATE, both together, or nothing.

Notes:

1. If a dotted decimal number has an asterisk (*) next to it and there is only one item with that dotted decimal number, you can repeat that same item more than once.
2. If a dotted decimal number has an asterisk next to it and several items have that dotted decimal number, you can use more than one item from the list, but you cannot use the items more than once each. In the previous example, you can write HOST STATE, but you cannot write HOST HOST.
3. The * symbol is equivalent to a loopback line in a railroad syntax diagram.

+ indicates a syntax element that must be included

The plus (+) symbol indicates a syntax element that must be included at least once. A dotted decimal number followed by the + symbol indicates that the syntax element must be included one or more times. That is, it must be included at least once and can be repeated. For example, if you hear the line 6.1+ data area, you must include at least one data area. If you hear the lines 2+, 2 HOST, and 2 STATE, you know that you must include HOST, STATE, or both. Similar to the * symbol, the + symbol can repeat a particular item if it is the only item with that dotted decimal number. The + symbol, like the * symbol, is equivalent to a loopback line in a railroad syntax diagram.

Notices

This information was developed for products and services that are offered in the USA or elsewhere.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. IBM Online Privacy Statement

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user's name, email address, phone number, or other personally identifiable information for purposes of enhanced user usability and single sign-on configuration. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at ibm.com/privacy and IBM's Online Privacy Statement at ibm.com/privacy/details in the section entitled "Cookies, Web Beacons and Other Technologies," and the "IBM Software Products and Software-as-a-Service Privacy Statement" at ibm.com/software/info/product-privacy.

Policy for unsupported hardware

Various z/OS elements, such as DFSMSdfp, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Minimum supported hardware

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those

products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: [IBM Lifecycle Support for z/OS \(www.ibm.com/software/support/systemsz/lifecycle\)](http://www.ibm.com/software/support/systemsz/lifecycle)
- For information about currently-supported IBM hardware, contact your IBM representative.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Web at [Copyright and Trademark information \(www.ibm.com/legal/copytrade.shtml\)](http://www.ibm.com/legal/copytrade.shtml).
